

Langley Design were pleased to work with ARJ Construction on the Irene House project in Balham, London. This £10 million project involved the conversion of a steel framed office block into 77 residential units. We manufactured and installed our Sheldon timber bin stores (SBS304) in various sizes to provide refuse storage for the residents keeping these external areas clear and tidy. The bin stores were built using structural grade treated redwood and also with a fire retardant to provide extra protection due to their locations on site. All our bin stores, cycle shelters and canopy units are designed with wind and snow loadings and our bin store can be provide roofed or unroofed dependant on the projects specific requirements. The client opted for a R32 profiled metal roof on this project to provide extra protection from the elements, whilst also offering the opportunity to match the project colour scheme.
